

Coding Boot Camp

Module 10

Programming

Programming refers to designing and building an executable program that will accomplish a specific computing task. Essentially, programming is problem-solving.

Algorithms and Automation

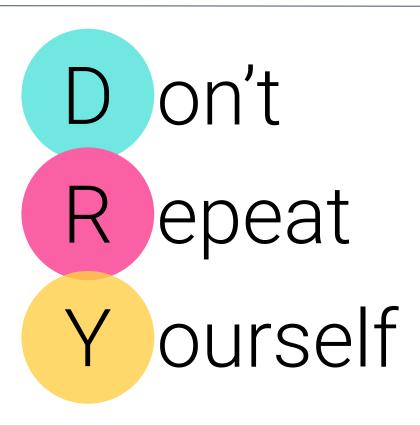

Programming enables us to solve almost any task or problem on a computer, usually in one of two primary categories: algorithms or automation.

Algorithms Automation

Don't Repeat Yourself (DRY)

DRY, or **Don't Repeat Yourself**, is a fundamental programming principle. Duplicate code wastes time and memory and can confuse readers or contributors to your project.

Objects

Objects in JavaScript are unordered collections of related data built on a key-value structure in which values can be any data type, including functions.

```
const person = {
 name: ['Bob', 'Smith'],
age: 32,
 gender: 'male',
interests: ['music', 'skiing'],
bio() {
  alert(
     `${this.name[0]} ${this.name[1]} is ${this.age} years old.
      He likes ${this.interests[0]} and ${this.interests[1]}.`
   );
},
 greeting() {
  alert(`Hi! I'm ${this.name[0]}.`);
},
};
```

Because Everything in JavaScript Is an Object!

Well, except for primitive data types. Everything else is an object—essentially a list of key-value pairs.

Data types

Data types that are objects

- Arrays
- Dates
- Math
- Functions
- And more!

Primitive data types (NOT objects)

- Null
- Undefined
- Strings
- Numbers
- Symbols
- Booleans

Creating Objects

We can use object literals, which define and create an object in one statement.

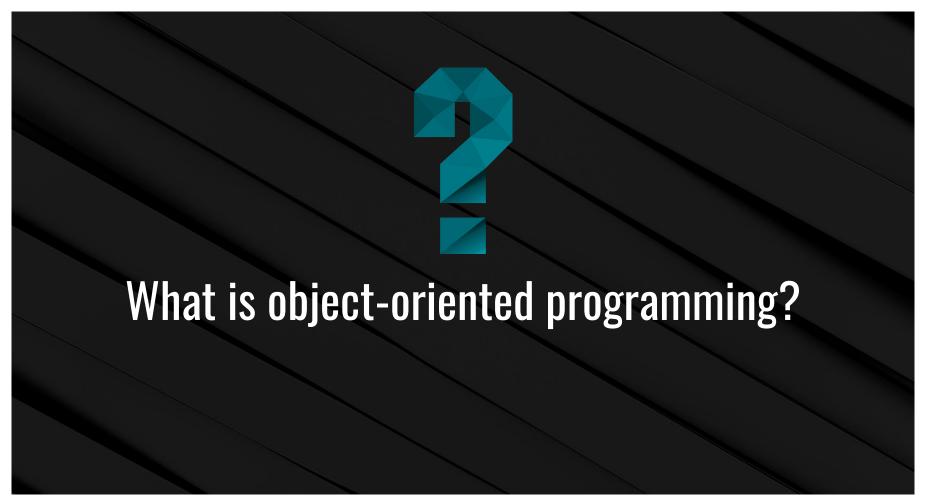

```
const car = { name: 'honda', model: 'civic', year: 2008, color: 'black' };
```

We can use the new keyword, which defines and creates a single object.

```
const Honda = new Car()
```

Or we can use **constructors**, which create objects from a blueprint.

```
class Car {
  constructor(name, model, year, color) {
    this.name = name;
    this.model = model;
    this.year = year;
    this.color = color;
}
```

Object-Oriented Programming (OOP)

is a programming paradigm, or pattern, centered around objects.

In object-oriented programming, we solve problems by employing collections of objects that work together.

Object-Oriented Programming (OOP)

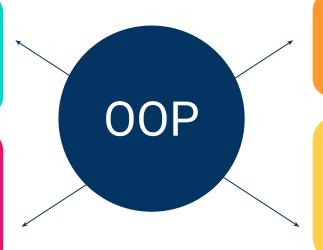

Their ability to communicate with each other makes objects particularly well-suited to address large, complex problems. OOP offers the following benefits:

Encapsulation

Object data (and often functions) can be neatly stored (i.e., encapsulated).

Inheritance

New classes can be created based on other classes (i.e., the Person class is parent to the Student and Teacher classes).

Abstraction

Creating a simple model of something complex.

Polymorphism

Multiple object types can implement the same functionality.

OOP is a broad concept that is best learned through real-life examples.

We begin to see the value of OOP when we use objects to model real-world things in code and provide functionality that would otherwise be hard or impossible to achieve.

How to Learn OOP

Try some of the following techniques to learn OOP:

Read the docs and practice with the provided examples.

Reverse-engineer finished code to see how it was created.

Build something from scratch.

Debug a broken app using Chrome DevTools.

And most importantly, ask questions!
